Draft for discussion · 6 August 2026

DR. PARK & GANA

Customer groups and value propositions

> **About this draft.** This follows the structure, sequence and wording of Charles Laporte Aust's first draft. Two things have been added: the supporting points under “Why” now carry registration numbers rather than capability statements, and a seventh segment has been proposed at tissue level. The partnership models are unchanged, as are the propositions.

1. AAV Co-development

SEGMENT 1 DR. PARK

WHO IS IT FOR?

Physician-scientists, inventors, specialist laboratories, universities, research institutes and rare-disease organizations.

THEIR PROBLEM

They may have an important gene-therapy invention, but lack the funding, regulatory expertise, CMC capabilities and manufacturing infrastructure required to turn it into a real therapy.

WHAT WE OFFER

A flexible, end-to-end co-development partnership — from early invention and regulatory planning through clinical development and industrial-scale manufacturing.

> **FROM INVENTION TO SCALE — WITH ONE COMMITTED PARTNER.**

WHY DR. PARK?

- Direct access to the principal decision-maker — the founder, Dr. Yongho Park
- Selective early investment and co-equity
- Regulatory and CMC development
- Plasmid and AAV development — 1,900 L fermentation with a dedicated GMP plasmid downstream suite
- Purification and analytics — chromatography-led, with Thermo Fisher DYNASPIN harvest
- **Phase 1 viral vector facility completed August 2025; cGMP certification targeted for 2026**
- A defined route from early development through to commercial-scale supply

PARTNERSHIP MODEL

Co-development, cash investment, contributed R&D and manufacturing resources, deferred fees, co-equity, royalties, licensing rights and long-term manufacturing agreements.

2. AAV Manufacturing

SEGMENT 2 DR. PARK

WHO IS IT FOR?

Biotechnology and pharmaceutical companies with defined AAV or gene-therapy programs.

THEIR PROBLEM

Their programs may be delayed by limited production capacity, long lead times, difficult purification, inconsistent quality or high manufacturing costs.

WHAT WE OFFER

High-purity, high-capacity AAV production designed to support advanced development, clinical supply and eventual commercial demand.

HIGH-PURITY AAV SUPPLY AT THE SCALE ADVANCED PROGRAMS DEMAND.

WHY DR. PARK?

- **Phase 1 viral vector facility completed August 2025 — cGMP certification targeted for 2026**
- **Designed for 5,000 L single-batch AAV production, up to 40 batches per year** — design capacity; Thermo Fisher Scientific selected as equipment supplier
- GMP plasmid manufacturing — 1,900 L fermentation, 4 kg per year
- Advanced chromatography-led purification
- Large-batch production in short timelines
- **Efficient manufacturing — batch scale translates directly into lower cost per dose**
- Direct and responsive decision-making

PARTNERSHIP MODEL

Process development, engineering batches, clinical and commercial manufacturing, capacity reservation and long-term supply agreements.

3. Strategic Biomanufacturing

SEGMENT 3 DR. PARK

WHO IS IT FOR?

Governments, sovereign investors, national biotechnology agencies and government-backed pharmaceutical companies.

THEIR PROBLEM

They want secure access to critical biotechnology infrastructure, greater domestic capability and reduced dependence on overseas suppliers.

WHAT WE OFFER

A strategic technology and manufacturing partnership that can provide capacity, technology transfer, workforce development and local production infrastructure.

BUILDING SOVEREIGN CAPACITY FOR THE NEXT GENERATION OF MEDICINE.

WHY DR. PARK?

- Phase 1 production infrastructure operating today, with a defined expansion pathway beyond it
- **A capacity roadmap extending to 200,000 litres of annual output at full build-out**
- Proprietary chromatography-led purification capabilities
- Technology-transfer potential
- Local manufacturing development and facility design
- Workforce training
- Flexible joint-investment structures

PARTNERSHIP MODEL

Public-private partnerships, joint ventures, sovereign co-investment, co-equity, technology licensing, local facility development and long-term capacity reservation.

4. Wound Care and Medical Device Partnerships PROPOSED

SEGMENT 4 GANA — GANA R&D

WHO IS IT FOR?

Wound care companies, medical device brands, hospital and long-term care distributors, and commercialisation partners holding market access in regulated territories.

THEIR PROBLEM

Chronic wound and pressure ulcer products are regulated medical devices, not cosmetics. A partner may hold market access, clinical relationships or a brand, but not a licensed manufacturer with the registrations required to supply those markets.

WHAT WE OFFER

A licensed medical device manufacturer with wound dressings already registered in multiple jurisdictions — including domestic approval — and the capability to manufacture under a partner's brand.

WE ALREADY MANUFACTURE THE DEVICE YOUR MARKET REQUIRES.

WHY GANA?

- **Licensed medical device manufacturer — MFDS manufacturing licence No. 4490**
- **Current GMP certificate — KCL-ABBA-19926, valid to 3 March 2027**
- **Three MFDS wound-dressing licences**, including 제인 20-4997 — the group's only domestic-sale approval, valid to November 2030
- **KoraVie Shield manufactured under MFDS licence 제인 25-4996**, granted 27 October 2025
- **Hydrogel wound dressing registered in Russia — P3H 2024/22431**
- **EU manufacturer registration active — EUDAMED SRN KR-MF-000037221**
- Manufacture under partner brand, with registration and dossier support

PARTNERSHIP MODEL

Contract manufacturing under partner brand, registration and dossier support, territorial supply agreements, co-development of next-generation dressings, and long-term supply.

Why this segment is proposed. Wound care is the best-evidenced product line in the group and appears in none of the six original propositions. It also serves a different buyer — hospitals and long-term care rather than aesthetic clinics, purchasing on clinical evidence rather than aesthetic outcome. Structurally it is what connects the two brands: it establishes GANA R&D as a licensed medical device manufacturer that also serves aesthetics, rather than a cosmetics supplier that also sells devices.

5. Clinic Portfolio Partnerships

SEGMENT 5 GANA

WHO IS IT FOR?

Independent aesthetic clinics, dermatologists, physician-led centres, clinic chains and hospital groups.

THEIR PROBLEM

Many clinics offer similar products and treatments. They need a stronger portfolio that serves different patient needs and helps the clinic stand apart.

WHAT WE OFFER

A broad, research-led portfolio combining reliable clinic essentials with differentiated and innovative aesthetic and regenerative products.

RESEARCH-LED PRODUCTS THAT MAKE CLINICS HARDER TO COPY.

WHY GANA?

- **We manufacture rather than outsource — MFDS manufacturing licence No. 4490, GMP certificate KCL-ABBA-19926 valid to 3 March 2027**
- **36 active product registrations across five jurisdictions, with GANA R&D named as manufacturer on every one**
- **Four separate chemistries registered under a single manufacturer — HA, PLLA, PCL and calcium**
- Dedicated in-house R&D
- Innovative combinations such as PLLA, PDRN and HA
- Novel peptides and regenerative technologies
- Treatment protocols, practitioner training and strong clinic economics

PARTNERSHIP MODEL

Curated product portfolios, clinic supply, practitioner training, treatment protocols, volume pricing, network agreements and selected exclusivity.

6. Market and Distribution Partnerships

SEGMENT 6 GANA

WHO IS IT FOR?

National distributors, importers, entrepreneurs and emerging aesthetic brands.

THEIR PROBLEM

They do not need another generic product catalogue. They need differentiated products, reliable documentation, attractive margins and a continuing pipeline of innovation.

WHAT WE OFFER

A differentiated product portfolio and innovation pipeline that partners can use to build a sustainable market and business.

A PORTFOLIO YOU CAN BUILD A MARKET AROUND.

WHY GANA?

- **Registration dossiers that already exist — 36 active product registrations across five jurisdictions**
- **A registration record a distributor can verify independently, rather than a claim we ask them to accept**
- **24 MFDS export-designated product licences — documentary evidence of sustained export activity**
- Broad and differentiated portfolio
- Continuous product innovation
- Reliable manufacturing and supply from our own facility
- Attractive distributor economics and market-specific portfolio planning

PARTNERSHIP MODEL

Territorial distribution, phased exclusivity, registration support, joint launch investment, market-development support and selected joint ventures or co-equity partnerships.

A market access map setting out which registrations are live in which territories accompanies this document.

7. Innovation and Product Co-development

SEGMENT 7 GANA

WHO IS IT FOR?

Established aesthetic and pharmaceutical companies, private-label brands, KOL physicians and treatment innovators.

THEIR PROBLEM

They may have a strong brand, market access or clinical idea, but lack the laboratories, formulation expertise or manufacturing infrastructure required to create a differentiated product.

WHAT WE OFFER

An external innovation and manufacturing engine that transforms scientific, clinical or commercial ideas into proprietary products and treatment platforms.

ADVANCED FORMULATION SCIENCE — WITHOUT BUILDING THE LABORATORY.

WHY GANA?

- Dedicated formulation and product-development laboratories

- **A licensed manufacturing site rather than a development house — MFDS licence No. 4490 with current GMP certification**
- **Automated filling at 20,000 vials per hour, with lyophilisation on site**
- **A registration track record partners can rely on — 36 active registrations across five jurisdictions**
- Proprietary technologies and ingredient combinations
- Flexible OEM and ODM development, testing, scale-up and manufacturing
- Regulatory support, and flexible IP and commercial structures

PARTNERSHIP MODEL

Paid development, OEM/ODM manufacturing, technology licensing, shared IP, royalties, exclusive rights, jointly funded development and co-equity in selected products or ventures.

How the two brands relate — three depths of manufacture

DR. PARK and GANA are not two unrelated businesses that happen to share an owner. They are the same activity carried out at three different depths, defined by what the product acts on and how far into the body it goes.

	Depth 1 — Surface	Depth 2 — Tissue	Depth 3 — Cell and gene
What we make	HA, PLLA, PCL, calcium, PDRN, peptides	Hydrogel and foam wound dressings	AAV vectors, plasmid, recombinant protein, peptides
Who makes it	GANA R&D	GANA R&D	Dr. Park CDMO
Evidence	7 Russian registrations across 4 chemistries; 21 MFDS licences	3 MFDS licences including domestic approval; P3H 2024/22431	Phase 1 facility completed Aug 2025; equipment installed
How we state it	**Made.**	**Made and registered.**	**Built. cGMP targeted 2026.**
Who buys it	Clinics, distributors, ODM	Hospitals, medical distribution, regulated markets	Biotech, pharma, governments
Segments	5, 6, 7	4	1, 2, 3

> **One manufacturer's name is on both the filler registrations and the wound dressing registrations, and the viral vector facility is on the same site under the same founder.** Large groups do span categories, but they do it by acquisition and outsource the production. A competitor can assemble a portfolio that looks like this by sourcing; they cannot get one manufacturer's name onto all of it.

Two further consequences follow.

Partners can move between layers. A clinic buying dermal products today is a candidate for regenerative combinations tomorrow. A distributor holding an aesthetic portfolio is a candidate for wound care in the same territory. A biotech buying process development is a candidate for commercial supply later. The portfolio is a path rather than a catalogue, which is what allows a partnership to compound.

One founder, one site, three depths. GANA R&D and Dr. Park CDMO operate from the same facility at 555 Dunchon-daero, Jungwon-gu, Seongnam, under the same founder. We do not claim a

single integrated technology platform spanning all three layers. We do state that the same organisation, on the same site, manufactures at all three — and that is unusual.

A note on how to put it: the point is not that one depth is more advanced than another. A dermal filler is a higher-risk device class than a wound dressing, and anyone in the field will know it. The point is the single manufacturer name across all of it.

What is common to both brands

- **Direct decision-making** — the founder is reachable, and decisions are made without committee
- **Flexible partnership structures** — cash, contributed R&D, deferred fees, co-equity, royalties, licensing
- **Selective investment** in partners and ideas we believe in
- **Manufacturing we own** rather than outsource
- **Registration and regulatory documentation support**
- **The ability to support an idea from early development through to commercial scale**

Open items

Items currently under confirmation. None of them blocks this document; they affect how specific figures may be used externally.

#	Item	Status
1	**Batch capacity figure**	The Thermo Fisher release states 5,000 L per batch for Phase 1; other materials carry different figures. Being reconciled into a single group fact sheet
2	**UK Class III contract manufacturing**	GANA R&D holds MHRA manufacturer registration MAN_ID 32678, updated 11 April 2026. Whether the device and its brand may be cited externally is governed by the manufacturing contract; under review
3	**EU market access**	Manufacturer registration is active in EUDAMED, but the CE certificate expired 27 May 2024. Renewal is required before devices may be placed on the EU market
4	**Corporate and asset ownership across group entities**	Under legal review; affects how certification history and patent record may be cited

Registration figures compiled from direct searches of the Roszdravnadzor, MFDS, MHRA, EUDAMED and ANVISA public databases, 22 July 2026, refreshed 6 August 2026. Every figure carries a public lookup path.
